I designed, built and debugged this 30m QRSS beacon in 2 hours, from 3 o'clock a.m. until 5 o'clock a.m. in the early hours before we left for the airport. It was a real last minute job! As such the design surely isn't perfect, and the construction a bit messy. I finished it just in time! It is built in a tiny Ozon mint tin and powered by my mobile phone charger: saves having to pack a separate PSU! The local copy of the signal (using my [30m QRSS receiver](#)) is shown above right.

The design:

- 2N3904 Colpitts transistor oscillator
- 2N3904 buffer
- 2N7000 FET "PA"
- 7-element low-pass filter
- Keying via ATtiny13

The ATtiny13 keyer wasn't built for this project, it was built for an earlier project, see my [Si570 beacon project](#)

. The circuit diagram:

For more photos of the antenna construction:

Aerial and installation

Below are some photos of the antenna installation. The villa in Grenada was on the hill overlooking Grenada's only golf course (9 holes). The antenna was a wire dipole with each leg measured at 7.1m long. At the centre was a balun made of 6 bifilar turns on a T37-43 toroidal core, fed by 5m of 50-ohm coax. The coax was fed directly by the output of the 7-element low pass filter in the transmitter. No ATU and no attempt to tune the dipole by trimming etc.

I used string to suspend the dipole so that the wire would be less likely to get snapped in the windy conditions on the hill. One end of the string was attached to the car port roof and the

other to a bush by the road side. The roof of the villa is tin so would have had some shielding effect. The antenna was only 1m from the roof of the villa and below street level for most of its length, though perhaps 4m above the swimming pool for part of its length. I hope the photos give some better idea that will aid this description.

The orientation of the aerial was such that the perpendicular (and direction of maximum radiation) should point approximately North-East - as judged by where the sun rose and set - and therefore approximately in a European kind of a direction. Given the close proximity of the tin roof and the number of approximations involved I'd be very surprised if the radiation pattern was anything close to dipole theory! One of these photos shows the view from the antenna to the North East so that you can see that even if there was a hill behind, and a tin roof 1m below, at least the view towards Europe was somewhat unobstructed!

{gallery}qrsstropical/antenna{/gallery}

In a couple of those photos you can see how the Ozon mint tin transmitter was taped under the eaves of the house. The red wires go into the house and were taped to my Nokia phone charger, providing 5V with more than enough mA to power this small QRSS signal.

Reports

A sample report from each station who copied the beacon is shown below. Immediately on switch on, I looked at the [online grabbers](#) and saw the signal clearly at G8NXD, W1BW then ON5EX. The local time in Grenada was about 20:19 (i.e. about an hour after dusk, by the time the antenna farming was complete). On the grabbers of W1BW you can see the moment of switch on at 00:19 GMT!

{gallery}qrsstropical/g8nxd{/gallery}

Mike G8NXD

The first "report" was when I looked at the grabber of Mike G8NXD and saw the signal clearly there in I
